Everyone from recent graduates to advanced users use Photoshop to edit, retouch, and enhance photos. Not all photo editing is created equal—I want to show you how to maximize your photo editing experience on a range of devices and with a wide variety of photo files. I was using Photoshop a few years ago when I stumbled onto a posting on Reddit from a man who was using Photoshop the “right” way. That same post was shared on Facebook and, in turn, on Twitter, and the spread of the post just grew. That post went viral. Since then, I have met many Photoshop users, and almost all of them have shared stories about how they love or hate the program. In this beginner’s guide, I’ll walk you through the basics of Photoshop Elements, so you can get the most out of your graphics-editing experience. What Is Photoshop Elements? Photoshop Elements is a free photo-editing program built for amateur and professional photographers. This popular photo editor gives you all the features of traditional Photoshop as well as tools for retouching, cropping, creating photos, making GIFs, designing buttons, making music, drawing, and creating web graphics. The program was originally designed as a way to give amateur photographers access to the features of professional-level Photoshop. It’s also designed with mobile devices in mind. You can edit images on your phone, tablet, or even a printed photo. The program has grown in popularity. You can download and try it out for free for 30 days. After that, you’ll need to purchase the program to continue using the software. Note: If you purchased Elements in 2015 or earlier, you’ll need to download the program again to continue using it. If you don’t have Elements, you can download the free trial version. What Do You Need to Use Photoshop Elements? You don’t need a lot of software to edit images. Photoshop Elements is very mobile-friendly, so you can use it on your tablet, on a phone, or even on a laptop. You’ll need the following: A tablet or smartphone to edit the images with A computer with at least 4GB of RAM, which is an absolute minimum You will need the following to download the trial version of Photoshop Elements: A valid Adobe ID. The embodiments described herein generally relate to the field of geotechnical analysis, and more particularly, to a method and apparatus for predicting the effects of a fluid-filled cavity on the structural integrity of a foundation or other geologic structure. It is known that the presence of groundwater can have a severe effect on the structural integrity of buildings and other structures. In particular, saturated zones or water-filled underground voids can potentially cause pore water pressures that exceed the allowable design values for the foundation. As one example, a hydrostatic load (i.e., a pore water pressure greater than the design pressure) on the foundation of a building may cause the foundation to crack, rock out, or otherwise fail. In some cases, even if the foundation does not fail, the hydrostatic load can cause damage to the building's foundation system, such as to the connection of a building wall to the foundation. Such damage may result in an improper connection of the building wall to the foundation, thereby leading to an increase in the potential for further damage and/or failure of the foundation and/or the building's foundation system. To address the problem of foundation damage due to groundwater, geotechnical engineers use a series of equations, known as the "half-space," to predict the effects of fluid pressures. This prediction process is generally performed using a two-dimensional numerical model of the structure, and is referred to herein as the "half-space method." The half-space method simulates the structure and the ground as two half-spaces, with the structure represented by the top half-space and the ground by the bottom half-space. A fluid-filled cavity is then modeled in the half-spaces between the structure and the ground, and these half-spaces are then allowed to slide relative to one another. The half-space method provides a way to simulate large structures such as houses and structures with an artificially-imposed discontinuity in the foundation material or a joint (such as a wall or pillar) in the structure. A drawback of this method, however, is that it is often difficult to determine whether the fluid pressures generated during the simulation actually predict real pressures that would be present within the structure in the field. Indeed, the results predicted by the half-space method generally does not accurately predict the manner in which the structure will perform in the field. Moreover, the half-space method can be a time consuming process, particularly for large structures. As an

Wednesday, November 16, 2014 How Can Blunt Objects Exit a Fire? The term "theory of the case" comes to mind when considering how fire enters a building. Fire can be caused by electrical malfunction, sun rays, or chemicals. Whatever the cause, once fire begins, the investigators are interested in learning what happened the first time the fire blazed forth into our world. As a former Fire Engineer, I think most firefighters are adequately trained on what we, as Fire Apparatus, know. But, what can we offer to help the insurance companies assess what, specifically, caused the fire to exist in the first place? How can we figure out what happened to cause the fire to break out? Since I know, or should know, several theories, I'll share a few facts or points, and then walk through a few of the theories and maybe even some fire science and reach a conclusion of my own. Platelet-type and Notch-type receptor distribution in non-neural ectoderm cells in Hydra. Platelet-type and Notch-type receptor have been reported to have similar functions in some vertebrate embryos. In this study, a qualitative and quantitative evaluation of platelet-type and Notch-type receptor distribution in the sea slug, *Hydra magnipapillata*, was performed. Platelet-type receptor expressions in the ectoderm cells were examined immunohistochemically using alphaIIb and c-kit (CD117) antibodies. Notch-type receptor expressions in the ectoderm cells were examined immunohistochemically using three of the *Drosophila* Notch-type proteins, Notch 1, Notch2, and Dlg1. It was found that the ectoderm cells expressed platelet-type receptor on the cell membrane. Immunohistochemical examination of Notch-type receptor revealed that the cells expressed all three Notch-type proteins. These findings suggest that Notch-type proteins function as signaling molecules in the ectoderm cells of *H. magnipapillata*.
